

How to Use the Anonymize Function

Protecting sensitive medical data and the identity of a biopsy's owner is not only ethical/polite, it is a legal responsibility.

Many of our software have features to hide potentially identifying information a slide may contain, such as by [hiding the barcode when sharing slides on My Pathomation](#), or [hiding labels and replacing filenames with Captions in Pathotrainer](#).

However, the best and safest practice with personally identifiable information is ***“if you don't need it, don't upload it in the first place”***

That's where the Anonymize tab in our free desktop viewer [PMA.start](#) comes in.

Simply go to the to tab, select the slides you want to anonymize, and run the program. It's done in seconds.
