Audit trailing

Describe what audit trailing is and why it exists; Probably needs to link to 21 CFR.11 at some point...

How does it work?

How did *we* implement audit trailing in PMA.core?

Consulting

How would one go about consulting the audit trail? Show screenshots from the SQLserver side?

Also indicate specific types of data that have pre-defined audit trail views already:

- Root directories
- Users
- ... (are there other pre-defined pages already?)

Notes on storage requirements

We have a way to monitor this in the installation check view, don't we?

Also: insert some suggestions on what people can do when the audit trail becomes too large.
