

Logs

The log file section provides access to the raw log files produced by the server. This page always displays log files available in a reverse chronological order so the latest log file is always on top. You can change the number of log files presented using the *Show Top* textbox.

There are two types of log files available:

- PMA.core log: These are PMA.core's internal logging system with information about *operations on the server, exceptions, errors, access log* etc.
- IIS log: These are raw IIS log files, containing all the requests made to the server along with all IIS logged info like *time taken, host, http status code* etc

Available log files		
Home > Log files
