

## Geo-replication and parallel uploads

Sometimes you have slides that you want to upload to multiple destinations. Two examples of scenarios where this is appropriate may be:

- You're using [PMA.control](#) on a global scale. Your PMA.control setup connects to multiple PMA.core instances for geo-replication purposes. Each PMA.core instance therefore must have access to the same slides locally.
- You're setting up one or more instances of PMA.slidebox. As you're explaining to the various instructors that are coming to your event how they can each manage their own slides, you wish to seed a number of root-directories with a pre-defined demonstration dataset.
